AeryxIQ

DRONE PACS AND AERIAL INSPECTION

QUICK START

Quick Start Guide

Install AeryxIQ, sign in, and file your first graded inspection study.

Version 1.0.1
On-Premises Edition
November 2026

Quick Start

From a boxed machine to a graded inspection study in about twenty minutes, most of which is a download.

What AeryxIQ is

AeryxIQ is a Drone Picture Archiving and Communication System. It takes the arrangement that radiology has used for forty years and applies it to aerial inspection.

In radiology	In AeryxIQ
Patient	**Asset**: the turbine, building, bridge or field you keep coming back to
Study	**Mission**: one flight over that asset on one day
Series	**Media set**: the photographs, the video, the thermal pass, the orthomosaic
Image	**Media item**: one frame, with its capture time and its position
Report	**Mission report**: graded findings, signed, exported as a PDF

The consequence worth having is the second flight. Once an asset has a history, this year's imagery is read against last year's rather than on its own, and a defect that is merely present becomes a defect that is moving.

Before you start

You need	Why
Docker Desktop, or Docker Engine on Linux	AeryxIQ runs as four containers
4 CPU cores, 8 GB memory	Comfortable for one reader and routine imports
Disk for the imagery	Your card capacity plus about half again
An internet connection for the install only	To download the images once. Afterwards it runs disconnected

Install it

Unzip the bundle somewhere you can find again, open a terminal in that folder, and run one line.

Windows

```
powershell -ExecutionPolicy Bypass -File .\up.ps1 -WithDemoData
```

Linux or macOS

```
./up.sh --with-demo
```

The demo flag loads sample content: four worked scenarios across wind, buildings, agriculture and public safety. It is worth having on the first run, and the Administrator Guide explains how to remove it when your own flights go in.

> **THE FIRST RUN TAKES A FEW MINUTES**
>
> It is downloading about a gigabyte of container images. Later starts take seconds.

Open it

When it is ready, AeryxIQ opens in your browser by itself at `https://aeryxiq.localhost`. If another program on the machine already uses port 443, it moves to `https://aeryxiq.localhost:8443` and says so. The Start Menu entry **Open AeryxIQ** always goes to the right address.

The browser will warn you about the certificate. That is expected and it is not a mistake. This installation issues its own certificate from an authority created inside it, because a product that had to ask the internet for a certificate could not be installed in a building with no connection. The traffic is encrypted either way. To stop the warning on this machine, run `trust-certificate.ps1` as an administrator, or `sudo ./trust-certificate.sh` on Linux.

The sign-in page asks for three things.

Field	What goes in it	Demo data
Company ID	Your organisation's short ID, chosen when the first administrator is created	`amhage`
Email	Your email address	`admin@example.com`
Password	Your password	`aeryx-demo`

One installation can hold several organisations without any one of them seeing another's flights. The Company ID is what keeps them apart.

Create your own administrator

On a first start without demo data, the window offers to do this for you. To do it later, or to add another organisation:

```
powershell -ExecutionPolicy Bypass -File .\new-admin.ps1
./new-admin.sh
```

It asks for a Company ID (short, lowercase, no spaces), an email address and a password of at least 12 characters, and creates the organisation if it does not exist yet. Sign in with exactly those three.

Your first study

Four steps, in the order the work actually happens.

1. Register the asset

Registry, New asset. Give it a name, pick its type from the 62 on offer, and drop a pin on the map. The type matters more than it looks: it decides the component vocabulary used later, so that a finding on a building can sit on a parapet or a spandrel while a finding on a turbine sits on a blade root or a leading edge.

Set the re-inspection interval while you are there. Buildings under a facade ordinance are on five years, mandated bridge inspections on twenty-four months, most other things annual. That one field is what makes the Flight Plan screen able to tell you what is due.

2. Open a mission

New mission on the asset. Pick the mission type from the 46 available, set the flight date, and name the pilot. The mission is the container the imagery lands in.

3. Put the imagery in

Copy the card off the drone and drop the folder onto the mission.

AeryxIQ reads each frame's EXIF capture time and GPS position. Where there is a gap of more than 45 minutes between consecutive photographs it treats what follows as a separate flight and files it as its own mission. One card holding a morning sortie and an afternoon sortie therefore arrives as two studies rather than one muddle. If your sorties are closer together than that, or further apart, change `FLIGHT_GAP_MINUTES` in `.env`.

> **ONE UPLOAD AT A TIME IS CAPPED AT 2 GB**
>
> A bigger card goes in as more than one upload. Flight splitting works across uploads, so the flights still come out right.

4. Read it and grade it

Open the mission. The filmstrip is down one side, the frame you are on fills the middle, and the flight track is on the map beside it.

Drag a box around a defect. Name what it is, from 72 categories, say where on the asset it sits, and grade it:

Grade	Means
G1	Minor

G2	Low
G3	Moderate
G4	Serious
G5	Critical

Then **finalise the report**. You get a PDF carrying the condition summary, the observation log, the annotated key images and a certification block in your own organisation's name and colour.

Where to go next

To do this	Read
Install on a server, an appliance, or a site with no internet	Installation Guide
Add people, set roles, require two-factor sign-in	Administrator Guide
Back it up, and restore it once before you need to	Administrator Guide
Remove the demo content	Administrator Guide

> **WHAT THIS SOFTWARE DOES NOT DO**
>
> AeryxIQ holds no engineering, surveying or inspection certification of any kind. Its automated assistance in grading and drafting is assistance. Every determination and every signature stays with the qualified person who makes it.

Help

Buy Support and **Upgrade to Cloud** are in the sidebar of the application and under the sign-in button.
